☰ Week #	1

How does the Web work?

Digging deeper

- What is a server?
- What is a transport protocol?
- Impact on performance:
 - Network
 - Server compute resources
 - Storage requirements
 - Client compute resources

Web Server

- Any old computer with a network connection can act as a web server
- Software:
 - Listen for incoming network connections on a fixed port
 - Respond in specific ways
 - Opening network connections, ports etc already known to OS
- Protocol:
 - What should client ask server
 - How should the server respond to the client

HTTP

- HyperText
 - Regular text documents
 - Contains "codes" inside that indicate special functions - how to "link" to other documents
- HyperText Transfer Protocol
 - Largely text based: client sends requests, server responds with hypertext documents
